# SPINNAKER 180 SAFE 4.0

Floatation chamber with single compartment in PA 420 PU COATED material with electronically-controlled high-frequency welds. Provides optimal positioning and perfect stability in the water. The thrust rotates an unconscious person and angles them so as to keep their airway free of water. What's more, once the chamber is inflated, it is possible to swim unimpeded to reach safety or to quickly climb into a lifeboat.

## ACTIVATION SYSTEMS:

- Automatic: upon falling into the water, the system automatically activates within 5 seconds of submersion, with the inflation of the floatation chamber. Automatic activation occurs thanks to the salt activator UML MK5, through the dissolution of a water-soluble tablet or with the Hammar MA1 hydrostatic activator due to the pressure generated from being immersed in the water by at least 10 cm.
- Oral: this type of inflation is achieved via the special mouth tube, with a non-return valve and protective cap. To inflate the chamber, simply blow into the tube. This will be useful for a further swelling/deflation awaiting emergency.
